►Duration: 8 semesters

Forecasting of the crime with matching between murders and google trends

ANDRES PEREZ CORONADO

PhD Student

GUSTAVO CANAVIRE

HENRY LANIADO

Thesis advisors

To design a spatial-temporal econometric model to anticipate how criminal networks must be dismantling.

Probabilistic model for foresight of organized crime, linked with social media.

1. Prediction model

- ✓ Definition Kernel Density Estimation (KDE)
- ✓ Latent Dirichlet Allocation (LDA)

2. Police Quadrants

- ✓ National Model of Community Policing by Quadrants (MNVCC)
- ✓ Murders statistic in Bogota D.C., Medellin and Cali

3. Google Trends and limitations

- ✓ Queries and trends
- ✓ Citizen security information

Prediction model

Matthew Gerber

Assistant Professor of Systems and Information Engineering

**Predicting crime
using Twitter and
kernel density
estimation -
ScienceDirect**

Kernel Density Estimation (KDE)

$$f_1(p) = k(p, h) = \frac{1}{Ph} \sum_{j=1}^P K\left(\frac{\|p - p_j\|}{h}\right)$$

T= type of crime

p= spatial point

P= total number of crimes T

j= indexes a single crime location

K= standard normal density function

$\|\cdot\|$ = Euclidean norm

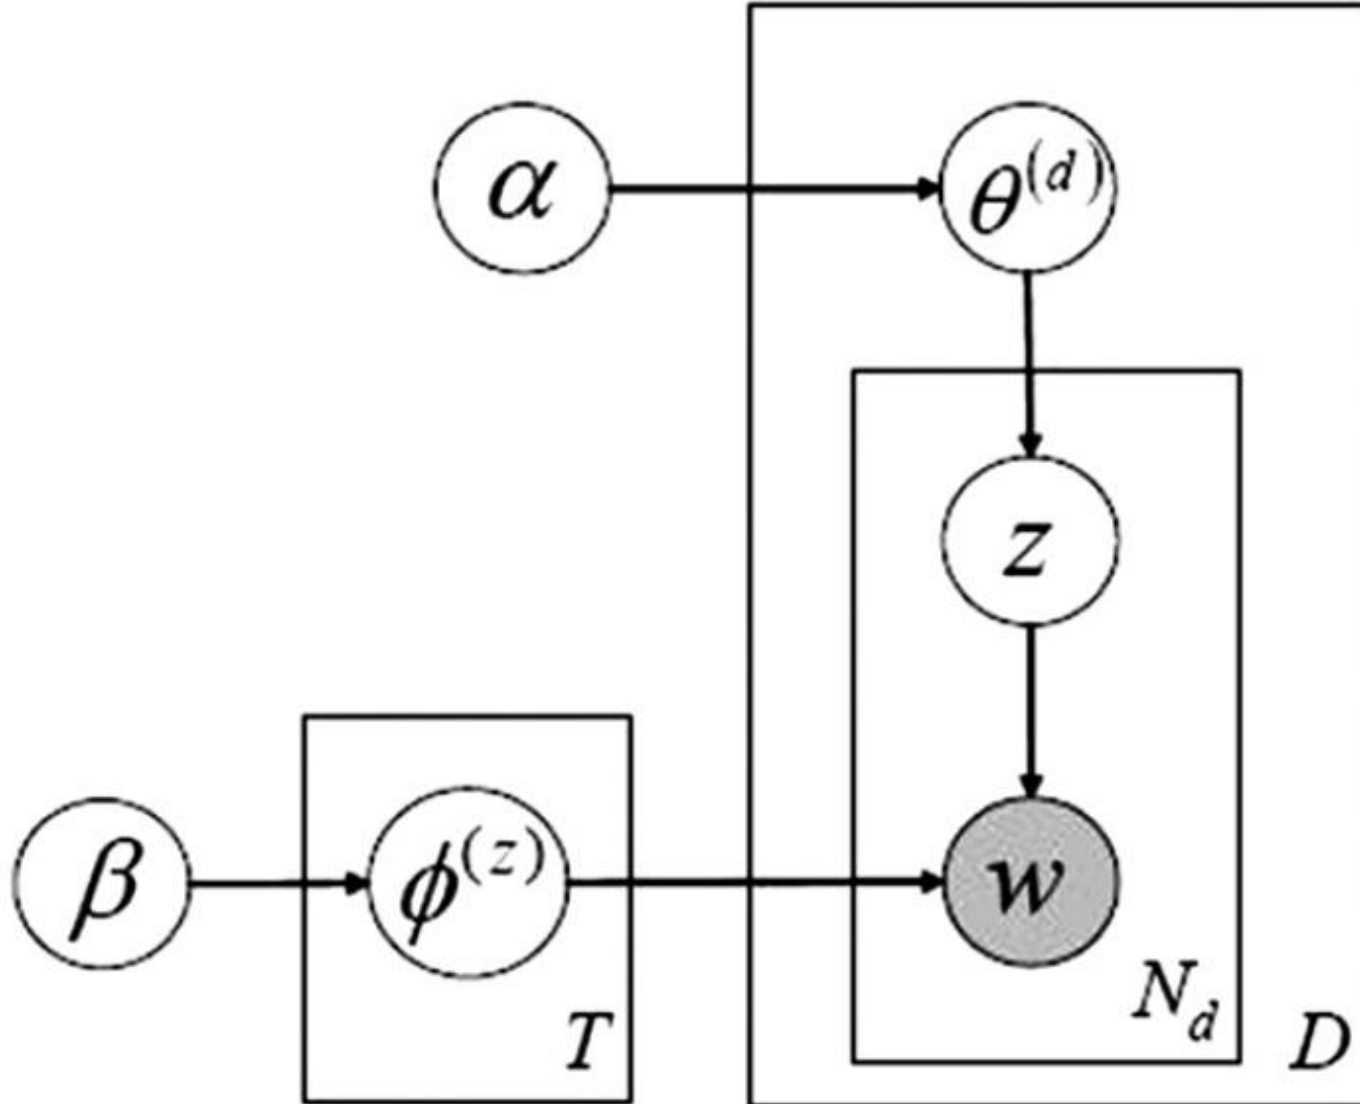

p_j = location of crime j

Kernel Density Estimation (KDE)

Fig. 3. Neighborhood boundaries for computing tweet-based topics. We only used the green neighborhoods (i.e., those within the city boundary) in our analysis.

Latent Dirichlet Allocation

Analytic approach

$$\Pr(\text{Label}_p = T | f_1(p), f_2(p), \dots, f_n(p)) = F(f_1(p), f_2(p), \dots, f_n(p))$$

T= type of crime

$f_1(p)$ = KDE

$f_2(p), \dots, f_n(p)$ = topics from LDA

F= logistic function

Predicting crime using Twitter

common noun, pronoun, proper noun, nominal
+ possessive, proper noun + possessive, verb,
adjective, adverb, interjection, hashtag*,
emoticon*, nominal + verbal, proper noun +
verbal, existential “there” + verbal.

Full model formulation

$$\Pr(t|r) \quad 1 \leq t \leq T = \text{\#topics}$$
$$1 \leq t \leq T = \text{\#neighborhoods}$$

Full model

$$\Pr(\text{Label}_p = T | f_1(p), f_2(p), \dots, f_n(p)) = \frac{1}{1 + e^{-(\beta_0 + \prod_{j=1}^n \beta_j f_j(p))}}$$

Probability interpolation function

$$\Pr_I(\text{Label}_p = T, W) = \sum_{j=1}^{|N(p,W)|} \frac{W - D(p, n_i)}{\sum_{j=1}^{|N(p,W)|} W - D(p, n_i)} * \Pr(\text{Label}_{n_i} = T)$$

Evaluation and results

M.S. Gerber / Decision Support Systems 61 (2014) 115–125

(a) Predicted threat surface using only the KDE feature.

(b) Predicted threat surface using the KDE feature and the Twitter features.

Quadrants of police

Quadrant

Quadrant definition

A quadrant is a fixed geographical sector that, based on its criminal, contraventional characteristics, social, demographic, geographical and economic services receives different types of police service, with orientation to the solution of problems of citizen coexistence and citizen security in the urban and rural areas.

The quadrant is the scenario of tactical and operational deployment in which all specialties converge of the police service.

According to the criminal, contraventional and geographical characteristics, the following may be defined: types of quadrants: urban, rural, road and river.

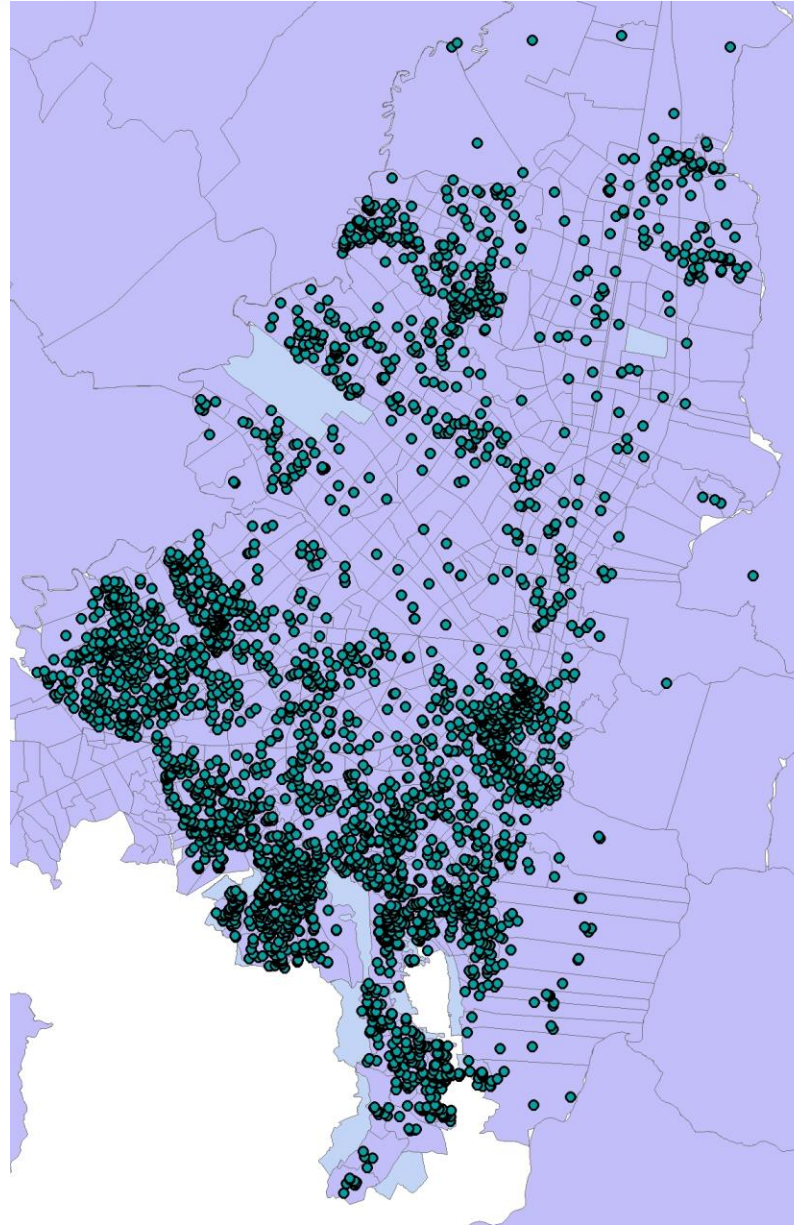

Medellin's murders

Cali's murders

Bogota D.C.'s murders

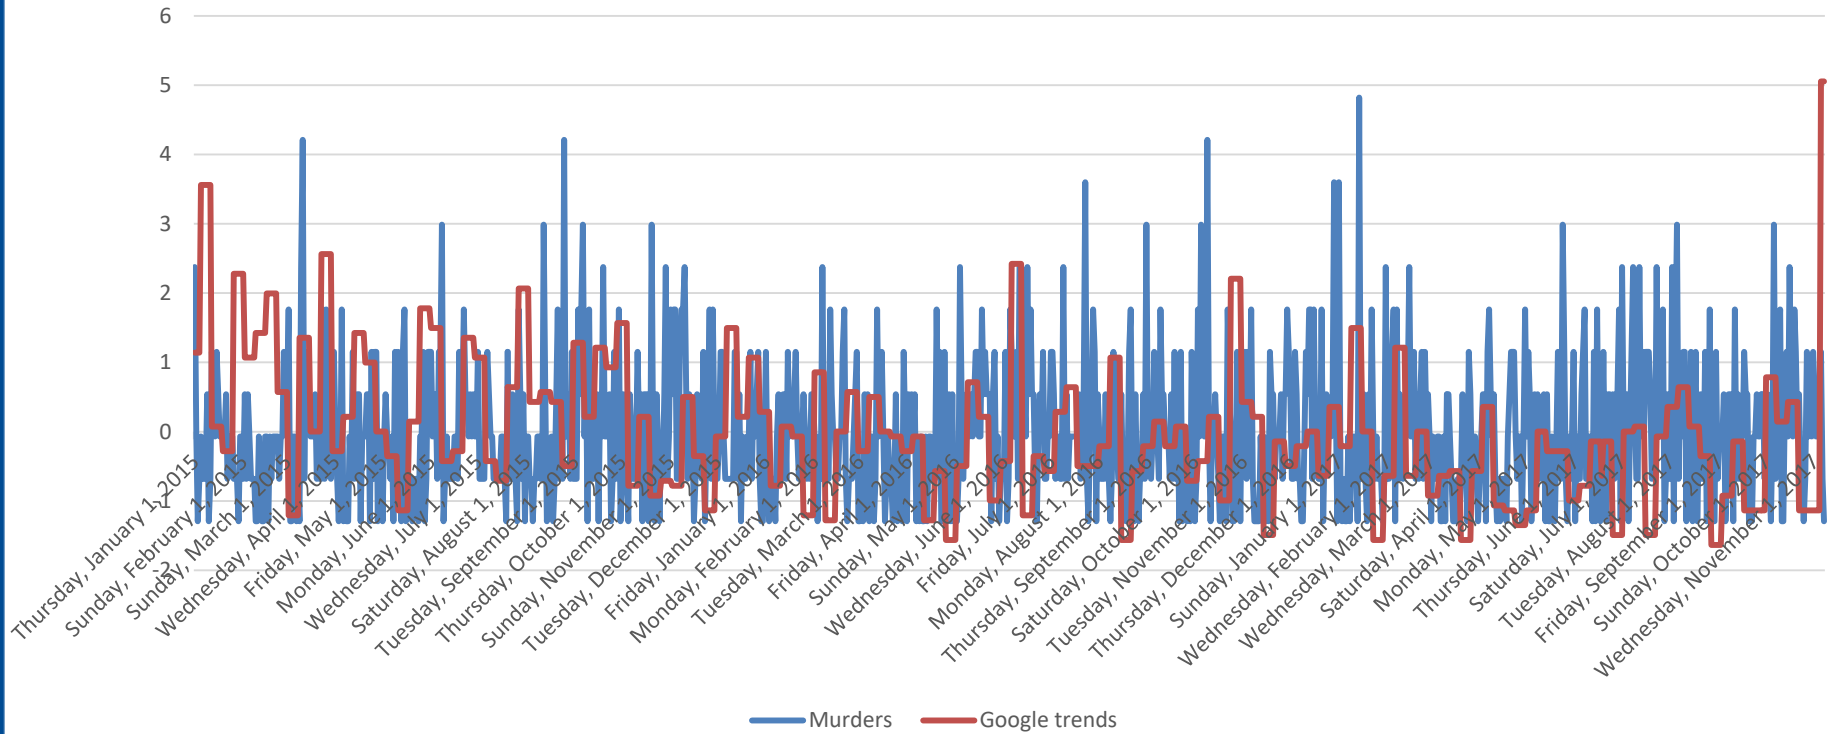

A large, semi-transparent grey letter 'G' is positioned in the upper left quadrant of the slide.A solid blue horizontal bar spans across the middle of the slide, serving as a background for the title text.

Google Trends and limitations

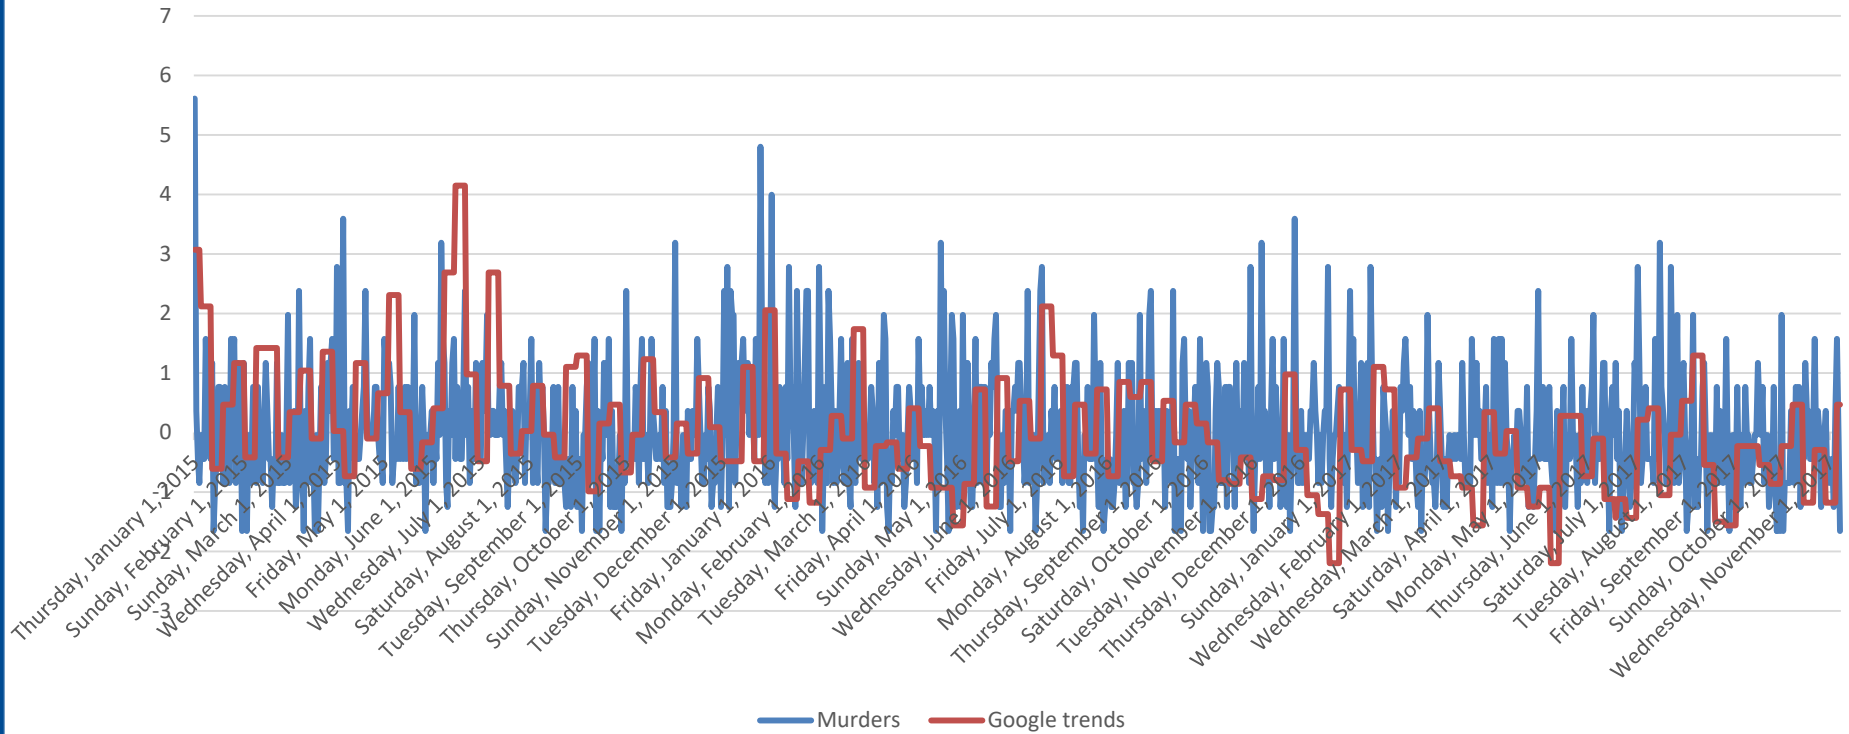

Statistics vs Trends

Medellin

Statistics vs Trends

Cali

Statistics vs Trends

Bogota D.C.

Limitations of information

- **Not too much georeferenced information, in databases and Twitter.**
- **The Colombian population doesn't habituate to use location data.**
- **Few access in rural areas to internet services.**

Conclusions

- **Police intelligence reports are the best way to complement social media information.**
- **Integral Analysis of Citizen Security and Coexistence (AISEC), to get information about criminal organization, and the social and policing context.**
- **Monitoring System for the Detection of Illicit Crops (SIIMA), to understand georeferenced information.**
